

“LIGHTBOX” TECHNOLOGY

- The lightbox technology adopted by Delta Bluegrass Company is an innovative diagnostic tool. The unbiased scientific data is used in selecting grasses that provide optimum drought benefits.
- The system uses a light source and digital photography to capture photographs of the various plots being analyzed. The photographs are then fed into a computer and are correlated into the quality aspects of color, density and texture. The system has the ability to then compare the readings of all the plots analyzed and rate them on a quality scale.
